

ABSTRACT

An engine mount (34) mounts a motive power (13) to a vehicle body. The engine mount includes an inner cylindrical member (55) attached to
5 the motive power, and a resinous bracket (54) attached to the vehicle body. The inner cylindrical member is elastically connected to the bracket. The bracket includes a cold shut portion (77) and a weak portion (63) provided at the cold shut portion. The cold shut portion is formed when the bracket is molded from molten resin. The weak portion has such a small strength
10 that, when the vehicle body collides with some object, the bracket is fractured to absorb the collision.
